Incident review, Q3 2026

Three incidents, none customer-visible for more than 40 minutes.

1. Export queue stall (Aug 12). One very large export held a worker; the queue drained in bursts. Fix: a per-job size cap and a separate pool for large jobs.
2. Expired internal certificate (Sep 3). The sync service’s certificate was issued by the internal CA and missing from every dashboard. Fix: cert-expiry-watch.
3. Rate-limit double count (Sep 21). Two instances, per-process windows. Accepted as a known approximation; see signal-api/Docs/rate-limits.md.

What we are changing: on-call reads the export dashboard first, not last.
